

Torque sensor TD175 20Nm

Item number: 3980

The torque sensor TD175 is used in test benches for measuring the reaction torque. (Wired, non-rotating).

The torque sensor consists of two flanges, which are connected with each other via 4 measuring spokes. The two flanges have the same pitch circle \varnothing 149mm. The centerings are designed as an external and internal collar with \varnothing 114,3.

Due to the large diameter of the torque sensor TD175 and the arrangement of the measuring spokes in the axial direction, this torque sensor can also absorb bending moments up to 200 Nm, which are caused by the dead weight of the drive motor.

The connection is made via a terminal box with M12 connectors.

Optionally, a GSV-1A measuring amplifier can be provided on the factory side instead of the terminal box so that the sensor has a voltage or current output of 10V or 12mA 8mA.
